It currently consists of 33 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         21.2.

The specification describes extracellular domains of BR43x2 (an isoform of the transmembrane activator and CAML-interactor (TACI) receptor). TACI or BGMA (a related B cell protein). These contain a cysteine rich domain, and are used for inhibiting zinff activity. They may also be used for inhibiting BR43x2, TACI or BGMA receptor-ligand engagement associated with activated or resting B lymphocytes, effector T-cells, or with antibody production. The antibody production is associated with an autoimmune disease selected from systemic lupus erythematosus, myasthenia gravis, multiple sclerosis and rheumatoid

arthritis. The zinf4 activity and BR43x2, TACI or BCMA receptor-ligand engagement is associated with asthma, bronchitis, emphysema, end stage renal failure, glomerulonephritis, vasculitis, nephritis, pyelonephritis, renal neoplasms, multiple myelomas, lymphomas, light chain neuropathy, amyloidosis, moderating immune response, immunosuppression, graft rejection, graft versus host disease, inflammation, insulin dependent diabetes mellitus, Crohn's disease, joint pain, swelling, anaemia, or septic shock. BR43x2, TACI, and BCMA polypeptides, fusions, antibodies, agonists or antagonists can be used to treat hypertension, renal artery stenosis, or occlusion, and cholesterol or renal emboli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     yThrPheSerGlyGlyH1sGluGlyH1sCysLysProTrpThrAspCysT 135

The present sequence is a cDNA encoding molecule associated with cell proliferation, MACP-5 from Incyte clone 2809903 isolated from TLYMNOT06 cDNA library. This sequence is expressed in cardiovascular and haematopoletic/immune tissues. MACP shows antiarteriosclerotic, anti-HIV, hepatotropic, antiinflammatory, antipsoriatic, cytostatic, antiasthmatic, immunosuppressive, osteopathic, nephrotropic, antiathyroid, thyromimetic, immunosuppressive, osteopathic, antiarthitic, uropathic, antialcor, and ophthalmological activities. The present sequence is useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /label= MACP-5_cDNA
/note= "This sequence is described as 764 bases long
in the Sequence Listing but a sequence of only 763 bases
is shown"
                                                                                                                                                                                                                                                                                                                                                                                Human; molecule associated with cell proliferation; MACP-5; Incyte clone 2809903; antiarteriosclerotic; hepatotropic; cytostatic; anti-inflammatory; antipsorialic; anti-IV; antiasthmatic; anamatic; dermatological; antidabetic; nephrotropic; antithyroid; thyromimetic; immunosuppressive; osteopathic; antiarthritic; uropathic; antiulicer; ophthalmological; diagnosis; treatment, prevention; immune disorder; cell proliferative disorder; actinic keratosis; arteriosclerosis; atherosclerosis; bursitis; hepatitis; Crohn's disease; amyloidosis; ss.

polypeptides. The PRO polypeptides, anti-PRO antibodies, agonists and antigonists are useful for treating and diagnosing immune related alsorders such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sjogren's systemic vaculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems (such as multiple sclerosis, idiopathic demyelinating polyneuropathy or Guillain Barre syndrome, and chronic inflammatory demyelinating polyneuropathy), hepatobiliary diseases (such as infectious, autoimmune chronic active hepathits, primary biliary cirrhosis, granulomatous hepatitis, and sclerosing cholangitis), inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's diseases, autoimmune or immune-mediated skin diseases (such as bullous skin diseases such as asthma, allergic rhinitis, atopic dermatitis, cod hypersensitivity and urticaria), immunological diseases of the lung (such as eosinophilic pneumonias, idiopathic pulmonary fibrosis and hypersensitivity pneumonias, idiopathic pulmonary fibrosis and hypersensitivity pneumonias, idiopathic pulmonary diseases including graft rejection and graft-versus-host diseases. present sequence is one of thirty three nucleic acids encoding PRO Thirty three nucleic acids encoding PRO polypeptides which are useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus

The invention relates to novel human angiogenesis-associated proteins designated PRO proteins (AAB53064-B53097), and to nucleic acids encoding proteins. The invention also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, PRO antibodies specific for a PRO protein, fusion proteins comprising a PRO protein, agonists or antagonists of a PRO protein, additionally encompasses methods of identifying modulators of PRO additionally encompasses methods of identifying modulators of PRO expression or activity; diagnosing a cardiovascular, endothelial or angiogenic disorder, or a susceptibility to such a disorder by detecting mutations in a PRO gene, or the expression level of a PRO gene within a particular tissue; treating a cardiovascular, endothelial or angiogenic disorder via a dinistration of a PRO protein, PRO nucleic acid; and methods of inhibiting or stimulating endothelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid for producing a PRO polypeptide, analyzing

cardiovascular, endothelial or angiogenic disorders, such as atheroscensis, osteoporosis, myocardial infarction, hypertension, diabetic retinopathy, rheumatoid arthritis, Crohn's disease, psoriasis, endometriosis, ulcers, wounds, cancer, Alzheimer's disease, Huntington's disease, or stroke. PRO nucleic acids are additionally useful in the recombinant production of PRO proteins, as hybridisation probes to screen libraries to isolate colNas with sequence identity to PRO proteins, to map genes encoding PRO proteins, to analyse genetic disorders, and in gene therapy. PRO nucleic acids can also be used to produce transgenic animals useful for the development and screening of potential therapeutic agents. The present sequence represents a cDNA encoding a PRO
cell growth, cardiac hypertrophy or PRO-induced anglogenesis via the administration of a PRO protein, or an agonist or antegonist thereof. PRO nucleic acids, PRO proteins, antibodies against PRO proteins, PRO agonists and PRO antagonists may be used as therapeutic agents to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    220
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      320
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            370

tructuating the prolitical compositions comprising the PRO polypeptide

or its antagonist have the opposite effect. A claimed method for
treating an immune related disorder, such as a T cell disorder,
treating an immune related disorder is selected from systemic
an antagonist antibody. The disorder is selected from systemic
lupus erythematcous, rheumatoid arthritis, osteoarthritis,
lupus erythematcous, rheumatoid arthritis, osteoarthritis,
lupus erythematcous, rheumatoid arthritis, osteoarthritis,
systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia,
systemic vasculitis, arcoidosis, autoimmune haemolytic anaemia,
autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus,
commune-mediated renal disease, damyelinated diseases (such as
multiple sclerosis), autoimmune chronic active hepatitis, primary
bullary chrinosis, granulomatous hepatitis, sclerosing cholangitis,
inflammatcry bowel disease (ulcerative colitis and Crohn's disease),
colitical and sease (ulcerative colitis and crohn's disease),
dluten-sensitive enteropathy, Whipple's disease, (autolimmune-mediated
skin diseases (such as bullous skin disease, erythema multiforme and
colitical and and graft-versus-host disease) (all almed).

Colaimed methods of dispanosing these discoafers comprise detecting
the level of expression of the PRO gene. Also claimed are a method
cof identifiing the aepression or
antitity of the PRO molvorers host cells.
                                                                                            Godowski PJ, Gurney AL;
Tumas D, Watanabe CK;
                                                                                                                                                                                                                                                                                                                                                                                                                 present sequence is that of cDNA clone DNA47365-1206 (ATCC 209436)
                                                                                                                                                                                                                                                                                                                                                                                                                                encoding novel human immunomodulator protein PRO364 (UN0319) (see AAB20115). The clone was isolated from a small intestine library. The protein clo kba, pl 6.34 shows homology to mouse GITR protein and may be its human counterpart. The invention provides polynucleotides (see AAF30050-62) encoding novel human PRO proteins (see AAB20108-20) including PRO364. Claimed compositions comprising these proteins or their agonists are useful for increasing infiltration of inflammatory cells into a tissue of a mammal,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 stimulating or enhancing an immune response in a mammal, or increasing the proliferation of T-lymphocytes in a mammal in response to an antigen. Claimed compositions comprising the PRO polypeptide
                                                                                                                                                                                                                                                                  New PRO polypeptides, nucleic acids and (ant)agonists, useful for diagnosing and treating immune-related disorders, such as multiple sclerosis, rheumatoid arthritis and diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cells, antibodies

The present sequence is one of seventeen nucleic acids encoding PRO polypeptides. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating cardiovascular, endothelial or angiogenic disorders in a mammal. Examples of these disorders include cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, Reynaud's disease, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis and lymphangitis. The PRO Polypeptides and antagonists are also used to prevent tumour angiogenesis and for treating periodontal diseases. They are also used to stimulate wound healing and tissue regeneration. The PRO nucleic acids, polypeptides and anti-PRO antibodies are useful for diagnosing a cardiovascular, endothelial or angiogenic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         other;

This EST has homology to tumour necrosis factor receptor (TNRN) family of polypeptides. PRO364 sequence also shows homology to members of the TNRR family and mouse GITR protein. This clone is assigned the ATCC deposit No: 209436. PRO364 functions as a neoplastic cell growth inhibitor and is used for treating tumours, using an effective amount of PRO655, PRO364 and PRO344. This composition is especially useful for treatment of human cancers such as breast, prostate, colon, lung, renal, ovarian and CNS, leukemia and melanoma.
                                                                                                for

This sequence encodes a PRO364 polypeptide, which is a human glucocorticoid-induced tumor necrosis factor receptor (hGTTR). The corresponding ligand (hGTTRL), PRO156. given in AAB47056.

PRO364 and PRO175 may be used in a mixture with a cardiovascular, endothelial, angiogenic or angiostatic disorder. The cardiovascular, endothelial, angiogenic or angiostatic disorder. The PRO364 sequence was isolated from an expressed sequence tag (EST) database as having homology to members of the tumour necrosis factor receptor (TNRP) family of polypeptides. The PRO175 cDNA sequence was isolated from an expressed sequence was isolated from an endothelial cells (HUVEC). Administering an effective amount of PRO364 or PRO175 or their antagonists is useful for treating cardiac hypertrophy (which is initiated by myocardial infarction and characterized by the presence of an elevated level of PGF_2alpha), trauma, a cancer, or age-related macular degeneration in a human. Administering a therapeutically effective amount of an antibody that binds PRO364 or PRO175 is useful for inhibiting anglogenesis induced by PRO364 or PRO175 is useful for inhibiting anglogenesis induced the vaccular-related drug targeting or as theirapeutic targets for the
                                                                                                                                                                                               Composition for diagnosing and treating cardiovascular, endothelial and anglogenic disorders, comprises a PRO364 or PRO175 polypeptide -

useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or angiogenesis and cardiovascularisation, andiogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with imappropriate PRO expression such as cardiovascular, endothelial angiogenic disorders in mammals (e.g. atheroscierosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCS) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and AAB24388 to AAB24335 represent nucleotide and protein sequences used in
                                                                                                                                                                                                                                                                                      present invention describes nucleic acids encoding PRO polypeptides

Novel PRO polypeptides and agonists and antagonists of them, used to diagnose and treat cardiovascular, endothelial and anglogenic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to methods for stimulating or inhibiting angiogenesis and cardiovascularization. The methods involve the use of pharmaceutical compositions based on the following proteins PR0179, PR0218, PR031, PR031, PR0313, PR0318, PR031, PR0317, PR084, PR0846, PR0815, PR031, PR0317, PR0817, PR0819, PR0882, PR0885 or PR0887. These proteins were identified by isolating cDNA clones encoding secreted proteins. The proteins of the invention may be used to diagnose and treat cardiovascular, endothelial or angiogenic disorders. The present sequence is a cDNA clone encoding one of the proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pitti RM;

proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                210

This is the nucleotide sequence of a novel cDNA clone, termed UN0319 or DNA47365-1206 (APCC 209436), that codes for PR0384 (see AAY06605), a novel member of the tumour necrosis factor receptor family. UN0319 was isolated from a human bone marrow tissue cDNA library by PCR amplification and probe hybridisation (see also CRA87876-75 and AAX87720-23). Nucleic acids comprising the present sequence, the PR0364 coding region, and DNA having at least 95% comprising amino acids 1-241, 1-X, 26-441 or 26-X of PR0364, where X is any of residues 157-167, and (b) DNA encoding mature PR0364, are claimed. PR0364 nucleic acids can be used in the recombinant C production of PR0364 nucleic acids can be used in the recombinant c production of PR0364 polypeptides, as probes, in gene and chromosome mapping, in the generation of antisense sequences, and c in gene therapy. PR0364 polypeptides are useful. for modulating apoptosis, NF-KB activation and proinflammatory or autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tumour necrosis factor receptor homologue - useful for, e.g. modulating apoptosis and NF-KB activation and proinflammatory autoimmune responses
                                                                                                                                                                                                                                                                                                                                                                                                                          "a nucleic acid comprising nucleotides
121-843 is specifically claimed in
Claim 3"
              PRO364; tumour necrosis factor receptor; human; apoptosis; inflammation; antiinflammatory; NF-KB activation; autoimmune disease; therapy; ds.

agonists/antagonists. The polypeptides, agonists or antagonists can be used for treating a disease state associated with aberrant cell survival. They can be used for treating immune deficiency disorders, Digeorge syndrome, HIV infection, severe combined immunodeficiency fortunat. They can be used for treating immune deficiency blood coagulation disorders, blood coagulation disorders, blood coagulation disorders, blood coagulation disorders, blood also be used to treat heart attacks, strokes, Addison's disease, has be used to treat heart attacks, strokes, Addison's disease, also be used to treat heart attacks, strokes, Addison's disease, and tiple sclerosis, myasthenia gravis, Stiff-Man syndrome, gisease, multiple sclerosis, myasthenia gravis, Stiff-Man syndrome, systemic lugus erythematosus, Guillain-Barre syndrome, insulin dependent diabetes mellitus or autoimmune inflammatory eye disease, anaphylaxis, hypersensitivity to an antigenic molecule, organ rejection or graft versus host disease, inflammatory conditions, ischaemia-reperfusion injury, complement-mediated hyperacute rejection, nephritis, cytokine or chemokine induced lung injury, inflammatory bowel disease, Crohn's disease, hyperproliferative disorders, or infections. They can also be used to repair, replace, or protect tissue damaged by congenital defects, trauma, age, disease, surgery, including cosmetic plastic surgery, fibrosis, reperfusion injury, peripheral nerve injuries, neuropathies, and central nervous system disease (e.g. Alzheimer's neuropathies, and shy-brager syndroms). The products can also be used for detection, diagnosis and prognosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 MetAlaGlnHisGlyAlaMetGlyAlaPheArgAlaLeuCysGlyLeuAl 17

The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             develop products for treating, transplantation rejection and

```
which includes an open reading frame coding for a 25 kbm human tumour necrosis factor receptor-like protein, designated TR11 (see AAY9589), which shows 58.6% identity to murine glucocorticolid induced tumour necrosis factor receptor family-related gene. The induced tumour necrosis factor receptor family-related gene. The TR11 CDNA was discovered in a cDNA library derived from T-helper cells, and was not found in any other CDNA library examined. TR11 activation-inducible. The TR11 ligand is constitutively expressed in an endothelial cell line. This suggests that TR11 and its ligand may be involved in activated T-cell trafficking. The invention provides TR11 xR11Styl and TR11Sty nucleic acids (see AAA50304-06) and encoded proteins (see AAY95879-81), as well as vectors, host cells and recombinant methods for their production. TR11styl and/or TR11Styl polypetides are useful for treating, preventing, preventing, preventing, preventing, preventing, preventing, munnodeficiency, especially common variable immunodeficiency,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            present sequence is that of cDNA clone HHEAC71 (ATCC 209341),

```
This is the nucleotide sequence of the human tumour necrosis factor receptor-like protein (TR11 receptor). The invention relates to TR11 and two splice variants TR11sV1 and TR11sV2. The nucleotide sequences were determined by sequencing cloned cDNAs AA237765-237766. The TR11 receptor and its splice variants show homology to the murine glucocorticoid induced tumour necrosis factor receptor family-related gene (GTRR). TR11, TR11sV1 and TR11sV2 polypeptides may be involved in the regulation of cell-type specific receptor-mediated cell growth, differentiation, and ultimately, cell death. They can be used for screening for
                                                                                                                                                                                                                                                                                              Tumour necrosis factor receptor-like protein (TR11), nucleotide sequence.

/note="Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with
a modified polylinker; Site_l: Not I; Site_2: Eco RI;
Equal amounts of plasmid DNA from three normalized
libraries (fetal lung NBH13W, testis NHT, and B-cell
NCI_CGAP_GCB1) were mixed, and ss circles were made in
vitro. Following HAP purification, this DNA was used as
tracer in a subtractive hybridization reaction. The driver
was PCR-amplified cDNAs from pools of 5,000 clones made
from the same 3 libraries. The pools consisted of
I.M.A.G.E. clones 297480-302087, 682632-667239,
726408-728711, and 729096-731399. Subtraction by Bento
Soares and M. Fatima Bonaldo. "
